R & RStudio a concise introduction

Dr Umberto Noè

The University of Edinburgh

Introduction

Welcome

Thank you for attending the short course **R & RStudio: a concise** introduction!

About me

- Dr Umberto Noè
- Senior Teaching Coordinator (Statistics) in the Department of Psychology
- Background in Statistics and Machine Learning

Goal

What this course is:

- an introduction to the fundamentals of the R programming language
- an overview of the RStudio interactive development environment (IDE)

Who this course is for:

someone that never used R

or

someone that used R a long time ago and needs a refresher

Prerequisites

There is no assumed prior knowledge of R programming You are only required to have:

- A basic understanding of descriptive statistics
- A basic understanding of data visualisation

Course overview

Schedule

Day 1: Tuesday 6th December 2022

Where: Lister Learning and Teaching Centre, room 1.16

Seminar 1: 9:00 - 11:00
Installing R: 11:00 - 12:00
Lunch break: 12:00 - 13:00

• Lab 1: 13:00 - 15:00

Day 2: Wednesday 7th December 2022

• Where: Lister Learning and Teaching Centre, room 1.16

• Seminar 2.A: 9:00 - 11:00

• Lab 2: 11:00 - 13:00

• Lunch break: 13:00 - 14:00

• Seminar 2.B: 14:00 - 15:00

Seminar 1 (Day 1): R building blocks

- Introduction to R and RStudio
 - What are R and RStudio?
 - Installing R and RStudio
 - The RStudio panes
 - Packages (CRAN vs GitHub)
 - Executing R code in RStudio (Console, Script files, Quarto files)
 - Comments
- R as a calculator
- Getting help
- Variables and their class (Numeric, Character, Logical)
- Basic functions
- Fundamental containers (Vectors, Matrices, Lists)

Seminar 2.A (Day 2): Everything data

- Grammar of data
 - Cases and variables
 - rownames, colnames
- Data frames
- A small detour
 - Factors
 - Missing values
- Subsetting data frames
 - Numeric vs Logical indexing
- Transforming variables
- More R functions

Seminar 2.B (Day 2): Advanced topics

- Control statements
 - apply
- Projects
- Paths
- Quarto

Seminar 1

What are R and RStudio?

R: Engine

RStudio: Dashboard

Installing R and RStudio

- Installation instructions vary with the operating system.
- Detailed guidance is provided in the following page:

https://uoepsy.github.io/files/install-update-r.html

The RStudio panes

Live demo

Packages

Live demo

• CRAN: palmerpenguins

• GitHub: taylor

Executing R code in RStudio

Live demo:

- Console
- Script file
- Quarto file

Providing help: comments

- Comment your code
- Comments are ignored by R
- Provide a helpful comment for a block of code, not every line of code

```
# This is a comment
### This is also a comment
```

```
# This is a
# multiline comment
```

R as a calculator

What will R print?

```
1 + 2
5 - 3
2 * 3
1/2
2^3
```

```
9^(1/2)
9^0.5
1 + 3 * 10
(1 + 3) * 10
sqrt(4)
```

R as a calculator

1 + 2	9^(1/2)
[1] 3	[1] 3
5 - 3	9^0.5
[1] 2	[1] 3
2 * 3	1 + 3 * 10
[1] 6	[1] 31
1/2	(1 + 3) * 10
[1] 0.5	[1] 40
2^3	sqrt(4)
[1] 8	[1] 2

Getting help: help pages

• Using the console

?sqrt help(sqrt)

- The F1 trick
- The Help pane
- The internet
 - Google and Stack Overflow
 - RStudio cheatsheets

Variables

What will R print?

x <- 3

X

y <- 2 * x

У

z <- x * y

Z

a <- Y * 3

A

Variables - Careful!

<- is called the **assignment operator**

```
x <- 3
x
```

[1] 3

[1] 6

[1] 18

```
a <- Y * 3
A
# Error! Names are case sensitive!
```

Variables

What will R print?

x <- 3

y <- 2 * x

z <- x * y

Variables

```
= also works!
x = 3
X
[1] 3
y = 2 * x
у
[1] 6
z = x * y
Z
```

[1] 18

Basics of functions

What is a function?

 You have already seen two examples of a function: sqrt(4) and help(sqrt).

```
# sqrt() square root function
num <- sqrt(4)
num

[1] 2
# help() - a function that works on functions
help(sqrt)

# c() is the combine function
nums <- c(2, 5, 9)
nums</pre>
```

[1] 2 5 9

What is a function?

- A function is a transformation that takes something as an input, does some computation with the input, and returns an output.
 - input: is a value
 - function_name: is the name of the computation to do to the input
 - output: is the result of the computation

output <- function_name(input)</pre>

What is a function?

Functions can also take more than one input
 output <- function_name(input1, input2, input3)

What is a function? Example

```
res1 <- sum(1, 2, 3)
res1

res2 <- rep(10, times = 6)
res2

res3 <- sum(res2)
res3</pre>
```

What is a function? Example

```
res1 <- sum(1, 2, 3)
res1
[1] 6
res2 \leftarrow rep(10, times = 6)
res2
[1] 10 10 10 10 10 10
res3 <- sum(res2)
res3
[1] 60
```

What is a function? Example

- Let's define a function that does what * does
 - Recall that a*b means $\underbrace{a+a+\cdots+a}_{b \text{ times}}$

```
multiply <- function(input1, input2) {
   numbers <- rep(input1, times = input2)
   result <- sum(numbers)
   return(result)
}</pre>
```

Always test!

```
10 * 5 multiply(10, 5)
[1] 50 [1] 50
```

Variables and their class

Numeric variables

What will R print?

```
x <- 3
x
y <- 2 * x
y
z <- x * y
```

```
data.class(x)
data.class(y)
data.class(z)
```

Numeric variables

```
x <- 3
x
[1] 3
y <- 2 * x
y
[1] 6
z <- x * y
z
[1] 18
```

```
data.class(x)
[1] "numeric"
data.class(y)
[1] "numeric"
data.class(z)
[1] "numeric"
```

Character variables

What will R print?

```
first_name <- "Umberto"
first_name

department <- 'Psychology'
department

nchar(department)
length(department)</pre>
```

```
data.class(first_name)
data.class(department)
```

Character variables

```
first name <- "Umberto"
first_name
[1] "Umberto"
department <- 'Psychology'</pre>
department
[1] "Psychology"
nchar(department)
Γ1 10
length(department)
[1] 1
```

```
data.class(first_name)
[1] "character"
data.class(department)
```

[1] "character"

Character variables

• What if you have an apostrophe withing a string of characters?

[1] "Let's"

```
# Use double quotes
"Let's"

[1] "Let's"

# Or the escape symbol \'
'Let\'s'
```

Logical variables

Logical variables are often obtained as the result of checking a condition.

What will R print?

```
TRUE
FALSE
!TRUE
!FALSE
2 == 3
2 == 2
```

```
2 != 3
2 != 2
2 > 3 # also >= available
2 < 3 # also <= available
!(2 > 3)
!(2 < 3)</pre>
```

Logical variables

TRILL	0 1- 2
TRUE	2 != 3
[1] TRUE	[1] TRUE
FALSE	2 != 2
[1] FALSE	[1] FALSE
!TRUE	2 > 3 # also >= available
[1] FALSE	[1] FALSE
!FALSE	2 < 3 # also <= available
[1] TRUE	[1] TRUE
2 == 3	!(2 > 3)
[1] FALSE	[1] TRUE
2 == 2	!(2 < 3)
[1] TRUE	[1] FALSE

Logical variables

```
data.class(TRUE)
[1] "logical"

data.class(FALSE)
[1] "logical"
```

Containers

Overview

In this section we will discuss different basic containers, designed to hold collections of values.

- A vector is a collection of values all of the same type
- A matrix is a tabular arrangement (in rows and columns) of values all of the same type
- A list is the most general container, and can also hold data of mismatching types as well as other containers.

A vector is a collection of values all of the same type.

```
# Create a vector with the combine function
c(1, 3, 5)
c(10, 11, 12, 13, 14, 15)

# sequence from 1 to 10
seq(10, 15)
seq(10, 15, by = 1)
```

A vector is a collection of values all of the same type.

```
# Create a vector with the combine function
c(1, 3, 5)
[1] 1 3 5
c(10, 11, 12, 13, 14, 15)
[1] 10 11 12 13 14 15
# sequence from 1 to 10
seq(10, 15)
[1] 10 11 12 13 14 15
seq(10, 15, by = 1)
```

[1] 10 11 12 13 14 15

```
# from:to is a short for seq(from, to, by = 1)
10:15
# you can combine vectors
c(1:4, 10)
# in steps of 2
seq(1, 10, by = 2)
# five equally spaced numbers
seq(0, 10, length.out = 5)
```

```
# from:to is a short for seq(from, to, by = 1)
10:15
[1] 10 11 12 13 14 15
# you can combine vectors
c(1:4, 10)
[1] 1 2 3 4 10
# in steps of 2
seq(1, 10, by = 2)
[1] 1 3 5 7 9
# five equally spaced numbers
seq(0, 10, length.out = 5)
[1] 0.0 2.5 5.0 7.5 10.0
```

An important function

```
years <- c(2007, 2008, 2009, 2010, 2011)
council <- c("Glasgow", "Fife", "Aberdeen")
length(years)</pre>
```

[1] 5

```
length(council)
```

[1] 3

• If you mix numbers and characters, everything will become a character!

```
data <- c(2, 6, "", 10)
data
```

```
[1] "2" "6" "" "10"
```

Matrices

A matrix is a rectangular arrangement of values in rows and columns.

```
M \leftarrow matrix(c(1, 2, 3, 4, 5, 6), nrow = 2)
М
     [,1] [,2] [,3]
[1,] 1 3 5
[2,] 2 4 6
M <- matrix(c("a","b","c","d","e","f"),</pre>
           nrow = 2, ncol = 3, byrow = TRUE)
М
     [,1] [,2] [,3]
[1,] "a" "b" "c"
[2,] "d" "e" "f"
```

Lists

 General containers that can hold data of mismatching types, different lengths, and even other containers.

```
L <- list(
    a = 1:10,
    b = matrix(c("a", "b", "c", "d", "e", "f"), nrow = 2)
$a
 [1] 1 2 3 4 5 6 7 8 9 10
$b
     [,1] [,2] [,3]
[1,] "a" "c" "e"
[2,] "b" "d" "f"
```

Lists

• General syntax:

```
list(item_name1 = item_value1,
    item_name2 = item_value2, ...)
```

Indexing is the practice of retrieving a specific entry from a data container.

```
# vector
v \leftarrow c(11, 22, 33, 44, 55, 66)
V
[1] 11 22 33 44 55 66
# matrix
M \leftarrow matrix(c(11, 12, 13, 21, 22, 23, 31, 32, 33),
            nrow = 3, ncol = 3)
М
     [,1] [,2] [,3]
[1,] 11 21 31
[2,] 12 22 32
[3,] 13 23 33
```

```
# list
L \leftarrow list(a = 101:103, b = M, c = "hello")
L
$a
[1] 101 102 103
$b
     [,1] [,2] [,3]
[1,] 11 21 31
[2,] 12 22 32
[3,] 13 23 33
$с
[1] "hello"
```

Vector: numerical indexing

```
What will R print?
v <- c(11, 22, 33, 44, 55, 66)
v

[1] 11 22 33 44 55 66
# vector[entries]
v[2]
v[c(1, 3)]
v[c(1, 2, 3)]
v[1:3]</pre>
```

Vector: numerical indexing

```
v <- c(11, 22, 33, 44, 55, 66)
# vector[entries]
v[2]
[1] 22
v[c(1, 3)]
[1] 11 33
v[c(1, 2, 3)]
[1] 11 22 33
v[1:3]
[1] 11 22 33
```

Vector: logical indexing

```
v <- c(11, 22, 33, 44, 55, 66)
v
[1] 11 22 33 44 55 66
# vector[mask]</pre>
```

v[c(TRUE, TRUE, FALSE, FALSE, FALSE, FALSE)]

What will R print?

v[v < 30]

Vector: logical indexing

```
v <- c(11, 22, 33, 44, 55, 66)

# vector[mask]
v[c(TRUE, TRUE, FALSE, FALSE, FALSE, FALSE)]

[1] 11 22
v[v < 30]

[1] 11 22</pre>
```

Matrix: numerical indexing

What will R print?

```
# matrix[rows, cols]
M[2,3]
M[c(1,2), 3]
M[c(1, 2, 3), 3]
```

```
M[, 3]
M[2, ]
M[c(1, 2), ] # or M[1:2, ]
```

Matrix: numerical indexing

```
[,1] [,2] [,3]
 [1,] 11 21 31
[2,] 12 22 32
[3,]
     13 23 33
# matrix[rows, cols]
M[2,3]
[1] 32
M[c(1,2), 3]
[1] 31 32
M[c(1, 2, 3), 3]
[1] 31 32 33
```

```
M[, 3]
[1] 31 32 33

M[2,]
[1] 12 22 32

M[c(1, 2),] # or M[1:2,]

[,1] [,2] [,3]
[1,] 11 21 31
[2,] 12 22 32
```

Matrix: logical indexing

What will R print?

```
M[c(TRUE, TRUE, FALSE),
M[c(TRUE, TRUE, FALSE),
c(FALSE, FALSE, TRUE)]
```

```
M[, c(TRUE, TRUE, FALSE)]
M[c(TRUE, TRUE, FALSE), 2]
```

Matrix: logical indexing

```
[,1] [,2] [,3]
 [1,] 11 21
                31
[2,] 12 22 32
[3,]
    13 23 33
M[c(TRUE, TRUE, FALSE), ]
                               M[, c(TRUE, TRUE, FALSE)]
    [,1] [,2] [,3]
                                    [,1] [,2]
[1,] 11 21 31
                               [1,] 11 21
[2,] 12 22 32
                               [2,] 12 22
                               [3,] 13 23
M[c(TRUE, TRUE, FALSE),
 c(FALSE, FALSE, TRUE)]
                               M[c(TRUE, TRUE, FALSE), 2]
[1] 31 32
                               [1] 21 22
```

List: numerical indexing

```
What will R print?
```

```
# list
L \leftarrow list(a = 101:103, b = M, c = "hello")
L
$a
[1] 101 102 103
$b
     [,1] [,2] [,3]
[1,] 11 21 31
[2,] 12 22 32
[3,] 13 23 33
$с

Child
          11
                21
                            31
Teenager 12 22
                            32
Adult 13 23
                            33
M["Child", "Right"]
[1] 21
M[c("Child", "Teenager"), "Right"]
   Child Teenager
     21
              22
```

rbind

```
rbind(
   c(1, 3, 5),
   c(11, 33, 55)
    [,1] [,2] [,3]
[1,] 1 3 5
[2,] 11 33 55
M1 \leftarrow matrix(1:6, 2, 3)
M2 <- matrix(11:16, 2, 3)
rbind(M1, M2)
    [,1] [,2] [,3]
[1,]
    1 3
[2,] 2 4 6
[3,] 11 13 15
[4,]
   12 14
               16
```

cbind

```
cbind(
   c(1, 3, 5),
  c(11, 33, 55)
    [,1] [,2]
[1,] 1 11
[2,] 3 33
[3,] 5 55
M1 <- matrix(1:6, 2, 3)
M2 <- matrix(11:16, 2, 3)
cbind(M1, M2)
    [,1] [,2] [,3] [,4] [,5] [,6]
[1,] 1 3 5 11 13 15
[2,]
   2 4
               6 12 14
                           16
```

rbind/cbind with names

• If you r/cbind vectors with names you will get:

```
v1 <- c(1, 3, 5)
names(v1) <- c("2010", "2011", "2012")
v2 <- c(11, 33, 55)
names(v2) <- c("2020", "2021", "2022")
```

```
rbind(v1, v2) cbind(v1, v2)

2010 2011 2012 v1 v2

v1  1  3  5  2010  1 11

v2  11  33  55  2011  3 33

2012  5  55
```

• Change any names you don't like with rownames() <- or colnames() <-.

Seminar 2.A

Grammar of data

- Data are organised in:
 - units or cases (rows)
 - variables (columns)

	name	start	end	party
1	Eisenhower	1953-01-20	1961-01-20	Republican
2	Kennedy	1961-01-20	1963-11-22	${\tt Democratic}$
3	Johnson	1963-11-22	1969-01-20	${\tt Democratic}$
4	Nixon	1969-01-20	1974-08-09	Republican
5	Ford	1974-08-09	1977-01-20	Republican
6	Carter	1977-01-20	1981-01-20	${\tt Democratic}$
7	Reagan	1981-01-20	1989-01-20	Republican
8	Bush	1989-01-20	1993-01-20	Republican
9	Clinton	1993-01-20	2001-01-20	Democratic
10	Bush	2001-01-20	2009-01-20	Republican
11	Obama	2009-01-20	2017-01-20	${\tt Democratic}$
12	Trump	2017-01-20	2021-01-20	Republican

Dataframes

- Dataframes are data containers in which:
 - all columns must have the same length, i.e. number of cases
 - the columns (variables) can be of different type (numeric, character, ...)
- Internally, dataframes are lists in which the items all have the same length.

Dataframes

```
DF <- data.frame(
    id = 1:3,
    name = c("a", "b", "c")
)
DF
  id name
1  1  a
2  2  b
3  3  c</pre>
```

```
L <- list(
    id = 1:3,
    name = c("a", "b", "c")
)
L
$id
[1] 1 2 3
$name
[1] "a" "b" "c"</pre>
```

Indexing dataframes

```
DF <- data.frame(
    id = 1:3,
    name = c("a", "b", "c")
)
DF
  id name
1  1   a
2  2   b
3  3   c</pre>
```

Just like lists:

```
DF$name
[1] "a" "b" "c"

DF$name[2]
[1] "b"

In addition:

DF[2, "name"]
[1] "b"

DF[2, 2]
[1] "b"
```

Palmer penguins data

 We will use data containing size measurements for adult foraging penguins near Palmer Station, Antarctica

```
penguins <- read.csv("data/palmer_penguins.csv")</pre>
dim(penguins)
[1] 344 8
nrow(penguins) # dim(penguins)[1]
[1] 344
ncol(penguins) # dim(penguins)[2]
[1] 8
names (penguins)
[1] "species"
                         "island"
                                               "bill_length_mm"
```

"year"

"flipper_length_mm" "body_mass_g"

[4] "bill depth mm"

"sex"

[7]

Palmer penguins data

• Top six rows of the data:

```
head(penguins)  # To show 10 rows: head(penguins, n = 10)
```

```
species island bill_length_mm bill_depth_mm flipper_length_mm bo

```

Palmer penguins data

Dataframe structure

'data.frame': 344 obs. of 8 variables:

```
str(penguins)
```

A small detour: factors and NAs

- Factor: tells R that a variable is categorical
- Missing value: NA, short for **not available**

To make a variable a factor:

```
penguins$species <- factor(penguins$species)</pre>
penguins$island <- factor(penguins$island)</pre>
penguins$sex <- factor(penguins$sex)</pre>
str(penguins)
'data.frame': 344 obs. of 8 variables:
 $ species
                   : Factor w/ 3 levels "Adelie", "Chinstrap", ...: 1 1
 $ island
             : Factor w/ 3 levels "Biscoe", "Dream", ...: 3 3 3 3
 $ bill_length_mm : num 39.1 39.5 40.3 NA 36.7 39.3 38.9 39.2 34.3
 $ bill_depth_mm
                   : num 18.7 17.4 18 NA 19.3 20.6 17.8 19.6 18.1 2
 $ flipper length mm: int 181 186 195 NA 193 190 181 195 193 190 ...
 $ body_mass_g : int 3750 3800 3250 NA 3450 3650 3625 4675 3475
 $ sex
                   : Factor w/ 2 levels "female", "male": 2 1 1 NA 1
                         $ year
```

Alternatively, you can use:

penguins <- transform(penguins,</pre>

```
species = factor(species),
                    island = factor(island),
                    sex = factor(sex))
str(penguins)
'data.frame': 344 obs. of 8 variables:
$ species
                  : Factor w/ 3 levels "Adelie", "Chinstrap", ...: 1 3
$ island
           : Factor w/ 3 levels "Biscoe", "Dream", ...: 3 3 3 3
$ bill_length_mm : num 39.1 39.5 40.3 NA 36.7 39.3 38.9 39.2 34.3
$ bill_depth_mm : num 18.7 17.4 18 NA 19.3 20.6 17.8 19.6 18.1 2
$ flipper_length_mm: int 181 186 195 NA 193 190 181 195 193 190 ...
$ body_mass_g : int 3750 3800 3250 NA 3450 3650 3625 4675 3475
$ sex
                  : Factor w/ 2 levels "female", "male": 2 1 1 NA 1
                        $ year
```

To assign new labels to the levels (possible categories):

or

```
str(penguins)
```

'data.frame': 344 obs. of 8 variables:

```
$ species
                 : Factor w/ 3 levels "Adelie", "Chinstrap", ...: 1 1
$ island
                 : Factor w/ 3 levels "Biscoe", "Dream", ...: 3 3 3 3
$ bill_length_mm : num
                       39.1 39.5 40.3 NA 36.7 39.3 38.9 39.2 34.1
$ bill_depth_mm
                       18.7 17.4 18 NA 19.3 20.6 17.8 19.6 18.1 2
                 : num
$ flipper_length_mm: int 181 186 195 NA 193 190 181 195 193 190 ...
                 : int 3750 3800 3250 NA 3450 3650 3625 4675 3478
$ body_mass_g
                 : Factor w/ 2 levels "M", "F": 1 2 2 NA 2 1 2 1 NA
$ sex
$ year
                        : int
```

head(penguins)

```

```

Missing values

• Missing values are a concern as they affect any subsequent computations:

```
11 + NA + 3

[1] NA

iq <- c(101, NA, 105)

mean(iq)

[1] NA

sd(iq)

[1] NA
```

Handling missing values

• A possible solution:

```
mean(iq, na.rm = TRUE)
[1] 103
sd(iq, na.rm = TRUE)
[1] 2.828427
```

Handling missing values

```
dim(penguins)
```

[1] 344 8

• Remove rows having missing values in **any** variable:

```
penguins_clean <- na.omit(penguins)
dim(penguins_clean)</pre>
```

[1] 333 8

• Remove rows having missing values in variables **bill_length_mm**, **sex**:

[1] 333 8

Shortcut

 Subset the penguins data to only keep the rows for which we have complete cases on bill_depth_mm and sex

[1] 333 8

Subset function

• Keep rows where rows_mask is TRUE, and keep columns in select:

```
subset(<dataframe>, <rows_mask>, select = <columns to keep>)
```

 Keep rows where rows_mask is TRUE, and drop columns with a minus in select:

subset(<dataframe>, <rows_mask>, select = -<columns to drop>)

Indexing data frames: numeric

```
penguins clean[1:2, ]
 species island bill_length_mm bill_depth_mm flipper_length_mm bo

  Adelie Torgersen
                       39.5
  Adelie Torgersen
                          40.3
```

Caution

 If you select only one column, the result is not a data frame anymore, but a vector:

```
head(penguins[, 3])
```

```
[1] 39.1 39.5 40.3 NA 36.7 39.3
```

drop = FALSE ensures the result is still a dataframe

```
head(penguins[, 3, drop = FALSE])
```

Indexing data frames: logical

- Logical subsetting is typically used to subset the data to only keep the rows satisfying a specific condition.
- For example, to keep only the rows where there are no missing values for bill_length_mm:

```
id <- complete.cases(penguins$bill_length_mm)
head(id) # first 6 values</pre>
```

```
[1] TRUE TRUE TRUE FALSE TRUE TRUE
penguins_clean2 <- penguins[id, ]
```

or

Key points

- After you read the data, always check for:
 - Variables that should be factors
 - If there are any variables with missing values

Transforming variables

 We have seen an example of transforming variables, when we changed some variables to be factors:

```
data$variable <- factor(data$variable)</pre>
```

or

 in general, factor(...) can be replaced by a generic computation on a variable.

Transforming variables

We can use the same logic to transform variables, i.e. changing existing ones or creating new ones.

• To create a new variable, use a new variable name

Transforming variables

To change an existing variable, overwrite the result into the same name

• **NOTE**: You should not do as above, as the label is now misleading. You should have created a new variables called body_mass_kg

More R functions

• Create a function that takes as input the dataframe and species name, and outputs a vector of average bill length for each year.

More R functions

```
get_averages <- function(data, species) {</pre>
    data <- data[data$species == species,
                         c("year", "bill length mm")]
    data 2007 <- data[data$year == 2007, ]
    data 2008 <- data[data$year == 2008, ]
    data 2009 <- data[data$year == 2009, ]
    M_2007 <- mean(data_2007$bill_length_mm, na.rm = TRUE)
    M_2008 <- mean(data_2008$bill_length_mm, na.rm = TRUE)
    M_2009 <- mean(data_2009$bill_length_mm, na.rm = TRUE)
    all_means <-c(M_2007, M_2008, M_2009)
    names(all means) \leftarrow c("2007", "2008", "2009")
    return(all means)
```

More R functions

```
all_means <- rbind(
    get_averages(penguins, "Adelie"),
    get_averages(penguins, "Chinstrap"),
    get_averages(penguins, "Gentoo")
)
rownames(all_means) <- c("Adelie", "Chinstrap", "Gentoo")
all_means</pre>
```

```
2007 2008 2009
Adelie 38.82449 38.56000 38.98269
Chinstrap 48.72308 48.70000 49.05417
Gentoo 47.01471 46.93696 48.50000
```

Pretty printing

• Use the kable function from the knitr package.

```
library(knitr)
kable(all_means, row.names = TRUE, digits = 2)
```

	2007	2008	2009
Adelie	38.82	38.56	38.98
Chinstrap	48.72	48.70	49.05
Gentoo	47.01	46.94	48.50

- It has options to:
 - show/hide row and column names (row.names = TRUE/FALSE, col.names = TRUE/FALSE)
 - round the results to a specific number of digits (e.g., digits = 2)

Shortcut - tapply

Chinstrap 48.72308 48.70000 49.05417

47.01471 46.93696 48.50000

Gentoo

Shortcut - tapply

```
knitr::kable(all_means2, row.names = TRUE, digits = 2)
```

	2007	2008	2009
Adelie	38.82	38.56	38.98
Chinstrap	48.72	48.70	49.05
Gentoo	47.01	46.94	48.50

Seminar 2.B

Control statements

- Control statements allow you to control the execution of the code until a certain condition is met.
- For: run code for a range of cases
- While: run code while a condition is true. Stop when it is false.
- If: run code if a condition is true

For

```
for (i in 1:10) {
    print(c(i, i<sup>2</sup>))
}
